PRACTICAL-9

Implement secure user registration by inserting user details into MySQL using MYSQLi. Validate input on frontend and backend, check duplicate email/username, hash passwords using password_hash(), and display appropriate messages.

Sql code:

ALTER TABLE students
ADD COLUMN username VARCHAR(50) UNIQUE;

Register.php

```php
<?php
include "db.php";

$message = "";
$success = false;

if ($_SERVER["REQUEST_METHOD"] == "POST") {

    $name = trim($_POST["name"] ?? "");
    $username = trim($_POST["username"] ?? "");
    $email = trim($_POST["email"] ?? "");
    $password = $_POST["password"] ?? "";

    // Backend validation
    if ($name == "" || $username == "" ||
        $email == "" || $password == "") {

        $message = "Please fill all fields.";

    } elseif (!filter_var($email, FILTER_VALIDATE_EMAIL)) {

        $message = "Please enter a valid email.";

    } elseif (!preg_match("/^[a-zA-Z0-9_]{3,50}$/", $username)) {
```

```
        $message = "Username must be 3-50 characters (letters, numbers,
underscore).";

    } elseif (strlen($password) < 8) {

        $message = "Password must be at least 8 characters.";

    } else {

        // Check duplicate email or username
        $check = $conn->prepare(
            "SELECT id FROM students WHERE email = ? OR username = ?"
        );

        $check->bind_param("ss", $email, $username);
        $check->execute();
        $check->store_result();

        if ($check->num_rows > 0) {

            $message = "Email or username already exists.";

        } else {

            // Secure password hashing
            $hashedPassword = password_hash(
                $password,
                PASSWORD_DEFAULT
            );

            // Insert user into database
            $stmt = $conn->prepare(
                "INSERT INTO students (name, username, email, password)
                 VALUES (?, ?, ?, ?)"
            );

            $stmt->bind_param(
                "ssss",
                $name,
                $username,
                $email,
                $hashedPassword
            );
```

```
            if ($stmt->execute()) {
                $message = "Registration successful!";
                $success = true;
            } else {
                $message = "Registration failed. Please try again.";
            }

            $stmt->close();
        }

        $check->close();
    }
}
?>
